This introductory text on ‘digital logic and computer organization’ presents a logical treatment of all the fundamental concepts necessary to understand the organization and design of a computer. It is designed to cover the requirements of a first-course in computer organization for undergraduate Computer Science, Electronics, or MCA students. Beginning from first principles, the text guides students through to a stage where they are able to design and build a small computer with available IC chips. Starting with the foundation material on data representation, computer arithmetic and combinatorial and sequential circuit design, the text explains ALU design and includes a discussion on an ALU IC chip. It also discusses Algorithmic State Machine and its representation using a Hardware Description Language before shifting to computer organization. The evolutionary development of a small hypothetical computer is described illustrating hardware-software trade-off in computer organization. Its instruction set is designed giving reasons why each new instruction is introduced. This is followed by a description of the general features of a CPU, organization of main memory and I/O systems. The book concludes with a chapter describing the features of a real computer, namely the Intel Pentium. An appendix describes a number of laboratory experiments which can be put together by students, culminating in the design of a toy computer. Key Features • Self-contained presentation of digital logic and computer organization with minimal pre-requisites • Large number of examples provided throughout the book • Each chapter begins with learning goals and ends with a summary to aid self-study by students.

Recent Progress in Surface Science, Volume 1 reviews significant advances made in surface science during the period 1956-1961, as well as problems that are still unsolved. Topics covered range from surface viscosity and electrode processes to corrosion of metals, surface-active substances, and foams and free liquid films. The electrical double layer and electrokinetic phenomena are also examined, along with facilitated diffusion and the chemistry of the semiconductor surface. Comprised of 11 chapters, this volume first deals with surface viscosity and general principles and applications of surface rheology, as well as the viscosity of various types of monolayers. The reader is then introduced to foams and free liquid films, with emphasis on the theory of foaming; the electrical double layer and electrokinetic phenomena; and electrode processes. Subsequent chapters explore the corrosion of metals; surface-active substances; surface chemistry of compound and organic semiconductors; and the mechanism of facilitated diffusion. The book also considers the morphology and dynamic aspects of cell contacts before concluding with an analysis of the formation and properties of bimolecular lipid membranes. This book will be of interest to chemists and physicists.

Deflection of an electron beam in a travelingwave cathode-ray tube can be accomplished in many ways. Of the methods discussed, a modification of the Pierce system is suggested that would enable a progressively larger deflection voltage to be applied to subsequent elements of the deflection system, without producing a nonlinear response. An initial investigation into the design requirements of such a system was carried out. A simple method of using a distributed amplifier as part of the deflection circuitry was atte pted. Although the output of the distributed amplifier was broadband, the outputs of the individual tubes could not be used because of unfavorable phase relationships. (Author).

This book presents extensive information on structural health monitoring for suspension bridges. During the past two decades, there have been significant advances in the sensing technologies employed in long-span bridge health monitoring. However, interpretation of the massive monitoring data is still lagging behind. This book establishes a series of measurement interpretation frameworks that focus on bridge site environmental conditions, and global and local responses of suspension bridges. Using the proposed frameworks, it subsequently offers new insights into the structural behaviors of long-span suspension bridges. As a valuable resource for researchers, scientists and engineers in the field of bridge structural health monitoring, it provides essential information, methods, and practical algorithms that can facilitate in-service bridge performance assessments.

The current material customer of translucent building materials Translucent materials give architects far more possibilities to exploit the sensual interplay of light and the fascination of interior-exterior interaction than plain glass, a fact proved by their increasing application. Traditionally, stretched paper, finely-cut stone, or stained glass were used to create mood and atmosphere. These are now giving way to a new generation of innovative materials - composite glass, synthetic panels, membranes and perforated metals.
