thematic science units can be found in these handy guides. Developed for educators who want to take an integrated approach, these teaching kits contain resource lists, reading selections, and activities that can be easily pulled together for units on virtually any science topic. Arranged by subject, each book lists key scientific concepts for primary, intermediate, and upper level learners and links them

to specific chapters where resources for teaching those concepts appear. Chapters identify and describe comprehensive teaching resources (nonfiction) and related fiction reading selections, then detail hands-on science and extension activities that help students learn the scientific method and build learning across the curriculum. A final section helps you locate helpful

experiment books and appropriate journals, Web sites, agencies, and related organizations. *The Human Body: Digestive, Circulatory, Reproductive, & Excretory Systems* Pearson Education India

The placenta is an organ that connects the developing fetus to the uterine wall, thereby

<p>allowing nutrient uptake, waste elimination, and gas exchange via the mother's blood supply. Proper vascular development in the placenta is fundamental to ensuring a healthy fetus and successful pregnancy. This book provides an up-to-date summary and synthesis of knowledge regarding placental vascular biology and discusses the relevance of this vascular bed to the</p>	<p>functions of the human placenta. <u>Early Bird Body Systems Teaching Guide S.</u> Chand Publishing A series of books for Classes IX and X according to the CBSE syllabus and CCE Pattern <u>Life Sciences Remedia Publications EARLY BIRD BODY SYSTEMS TEACHING GUIDE</u> Sanders' Paramedic Textbook includes Navigate Advantage Access Oswal Publishers</p>	<p>Goyal Brothers Prakashan <i>Molecular Biology of the Cell</i> Goyal Brothers Prakashan This e-book will review special features of the cerebral circulation and how they contribute to the physiology of the brain. It describes structural and functional properties of the cerebral circulation that are unique to the brain, an organ with high metabolic demands and the need for tight water</p>

and ion homeostasis. Autoregulation is pronounced in the brain, with myogenic, metabolic and neurogenic mechanisms contributing to maintain relatively constant blood flow during both increases and decreases in pressure. In addition, unlike peripheral organs where the majority of vascular resistance resides in small arteries and arterioles, large extracranial and intracranial

arteries contribute significantly to vascular resistance in the brain. The prominent role of large arteries in cerebrovascular resistance helps maintain blood flow and protect downstream vessels during changes in perfusion pressure. The cerebral endothelium is also unique in that its barrier properties are in some way more like epithelium than endothelium in the periphery. The cerebral

endothelium, known as the blood-brain barrier, has specialized tight junctions that do not allow ions to pass freely and has very low hydraulic conductivity and transcellular transport. This special configuration modifies Starling's forces in the brain microcirculation such that ions retained in the vascular lumen oppose water movement due to hydrostatic pressure. Tight water

regulation is necessary in the brain because it has limited capacity for expansion within the skull.

Increased intracranial pressure due to vasogenic edema can cause severe neurologic complications and death.
