Woodhead and Wicker's new text will be the foremost reference source for all perioperative practitioners. The content mirrors the dynamics of modern perioperative practice by focusing on surgical interventions in all the environments in which it is currently practised, including A&E departments, general practice clinics, intensive care units, and at the site of serious accidents. Theatre practice is becoming increasingly specialist; this book does not attempt to reflect the needs of all specialties, but instead concentrates on the principles of practice, applicable to any setting and any specialty. It has a very practical focus - it aims to be the book that nurses and ODPs reach for in order to answer their practical questions - but is not procedure-driven. Instead, it sets out the principles of perioperative practice, from

which practitioners will be able to develop their own practice techniques. Reflects principles of practice, applicable to any perioperative environment. Strong practical focus. Edited by two of the biggest 'names' in the international perioperative nursing sphere, with contributions from other well-known and authoritative sources. Excellent opportunities to develop links with the National Association of Theatre Nurses and the European Operating Room Association. The team of contributors are experienced practitioners working directly with perioperative patients or in perioperative education. An original model for ethical practice is proposed: the Reid model is the first such ethical model to be proposed for the perioperative environment. Includes one of the only chapters in any perioperative book which specifically focuses on the care of the elderly. The research chapter encourages the use of evidence based practice and the development of perioperative research. The unique chapter on care of the mentally ill will support practitioners who are not qualified in psychiatry to care for mentally ill patients. This is an area where there is a great information deficit. Key points listed for each chapter. Sections have been completely revised from previous edition - key subject areas now stand-alone chapters rather than sections within much larger chapters - creates ease of access for user. Change of editorship. Recognises the diversity of perioperative environments much more explicitly than previous edition.

This new edition meets the requirements of the revised Core Curriculum for Surgical Technologists, 5th edition. It is written by surgical technologists for surgical technologists. The content focuses on the concepts and skill development (cognitive and procedural) required of surgical technologists in the operative environment. The goal is for the surgical technologist to apply this model in daily practice for maximum efficiency and effectiveness during the surgical procedure. The surgical procedures included in the text were selected for their instructive value and because the skills demonstrated can be applied to many other procedures.

Introduction of the Operating Room Assistant to the Surgical Environment Springer Science & Business Media

The operating room (OR) department is one of the most expensive area to run in a hospital. The cost per minute to run the OR is \$33/minute, so decreasing the time will save the hospital a significant amount, even if it is a minute per turnover. This research looks at to reducing the turnover time (non-operative time) and variation in the OR by using standardization. Data collection consisted of observation and interviews of the circulating nurses, surgical techs, and aides to identify causes of delays and long turnovers. It was determined that the turnover could be divided into two stages: cleaning of the room and setting up for the next surgery. With this in mind, the research team met with the cleaning staff (aides) to create a standard operating procedure. Preliminary tests with the cleaning procedure proved to be promising, and a full-scale implementation in all ORs and

surgery types was carried out. Along with a cleaning procedure, standardization of tasks for the three staff types helped to decrease the time of cleaning the OR, setup of a room, and the overall time. The overall turnover time decreased by two minutes and standard deviation decreased by almost two minutes for all surgery types throughout the OR department. The decrease in time will allow the OR to hire more staff to increase the efficiency of setup for the turnovers. A decrease in standard deviation signifies more consistent turnovers which create more predictable times for scheduling in the future.

Essentials of Perioperative Nursing Elsevier Health Sciences
Operating room (OR) turnover cleaning is an important part of perioperative workflow for surgical teams, particularly to prevent cross-contamination of infectious pathogens from the surgical environment to staff and patients. Incomplete OR turnover cleaning ultimately leaves vulnerable surgical patients at risk for surgical-site infections (SSIs) and other types of hospital acquired infections (HAIs), which leads to delays in overall operations of the OR. A microsystem assessment at a large metropolitan hospital revealed an issue with incomplete OR turnover cleaning evident by the presence of dirty canisters, filters, and unclean anesthesia machines/work-areas after sterile surgical supplies had already been opened in preparation for following surgical procedures. The project aimed to reduce the number of incomplete OR turnover cleaning (IORTCs) events. This was

achieved by utilizing the Work Enhanced Turnover Cleaning (WETOC) Project which enhanced turnover cleaning communication between key players in this process. Daily audits were taken to evaluate the WETOC Project. Compliance goals were met for all three months after implementation at 50%, 70%, and 90% respectively. IORTC occurrence goals were also met with three occurrences in the first month, and no occurrences in the second and third months. Ultimately, the WETOC Project was found to be effective in reducing the incidence of IORTCs. Maintaining staff compliance to the WETOC process was necessary in sustaining goals and reducing IORTC, which is feasible through quality control audits, and strong leadership support.
