Updated Procedures for Determining Gifted Eligibility for Underrepresented Students. Research Note. RN1201 The Medicine Publishing Company

This Open Access book summarizes the key findings from the second cycle of IEA's International Computer and Information Literacy Study (ICILS), conducted in 2018. ICILS seeks to establish how well schools around the globe are responding to the need to provide young people with the necessary digital participatory competencies. Effective use of information and communication technologies (ICT) is an imperative for successful participation in an increasingly digital world. ICILS 2018 explores international differences in students' computer and information literacy (CIL), namely their ability to use computers to investigate, create, and communicate at home, at school, in the workplace, and in the community. Participating countries also had an option to administer an assessment of students' computational thinking (CT), focused on their ability to recognize aspects of real-world problems appropriate for computational formulation, and to evaluate and develop algorithmic solutions to those problems, so that the solutions could be operationalized with a computer. The data collected by ICILS 2018 show how digital competencies can be assessed using instruments representing authentic contexts for ICT use, and how students' CIL and CT skills relate to school learning experiences, out-of-school contexts, and student characteristics. Those data also show how learning technologies are used in classrooms around the world. Background questionnaires asked students about their use of ICT, and collected information from teachers, schools, and national

education systems about the resourcing and teaching of CIL (and CT) within their countries. The results of ICILS 2018 will enable policymakers and education systems to develop a better understanding of the contexts and outcomes of CIL (and CT) education programs.

Principles and Practice of Geriatric Psychiatry Psychology Press

This second edition continues to present the following special features of its highly successful predecessor: * an analysis of the major partitionings of the MMPI into special scales in terms of their clinical usefulness, resulting in the selection of those scales that most discriminately and non-redundantly represent the core psychological traits and qualities captured by the MMPI; * a number of individually developed scales that tap into additional aspects of validity, psychopathology, and adjustment and personality; * the Indiana Special Scales which sample additional areas that were not as well identified or delineated by prior scale development; * a critique of the foregoing selections in light of the extant MMPI literature (which this second edition further expands up to the current time) and of a major investigation at the Indiana University Medical School of the conjoint use of special scales; * a critique of the shortcomings of high-point codes; * a detailed, categorized listing of the most useful scales in empirical clusters based on their established intercorrelations such that not only scale elevations but also interrelations (and the departures from the expected) of scales become clinically interpretable; * an exploration of the interrelationships between Rorschach and MMPI variables, leading to complementary use of these two instruments. This second edition also takes into account the development of MMPI-2 and the status of its new special scales vis-a-vis the established scales derived from the original MMPI. In so doing, it indicates why the original scales continue to offer substantial advantages over the MMPI-2 scales. It further examines changes in the nosology of personality

disorders and proposes special scale markers for these disorders as they have been clarified progressively through DSM-IV. This volume offers the MMPI user a library of psychological report statements based on special scale interpretation, with recommended score ranges and cutting points for particular inferences. These latter features appear together as an appendix styled as "The Human Computer." Unlike the typical computer-generated report, this appendix makes all decision rules explicit, thereby permitting the user to use the library of statements with full knowledge of their applicability. By retaining the element of clinical judgment -- the human dimension of inference -- the user is enabled to better integrate MMPI special scale findings with data from other sources while in the process of crafting the report. All of these new features are accompanied by applicable literature citations.

Measurement Scales Used in Elderly Care Springer Nature

There are a number of detailed requirements for gifted screening, referral and eligibility specified under State Board Rules and School Board Rules. In all of these areas, explicit mention is made of the Florida Comprehensive Assessment Test (FCAT) scores as being integral components. The FCAT scores used for these purposes prior to 2008 were percentiles as reported in the Norm Referenced Test (NRT) result reports. The Florida DOE discontinued administration of the NRT starting in 2008. With NRT scores no longer available, screening, referral, and eligibility specifications were modified and provisions made for using FCAT Sunshine State Standards (SSS) data as a substitute measurement of academic achievement. With the advent of FCAT

2.0 specifications, the scoring scales have changed and the references to cutoff scores need to be adjusted. In anticipation of these needs, members of the Division of Advanced Academic Programs and Assessment, Research and Data Analysis collaborated on the suggestion proposed in this Research Note. This investigation focuses on the Gifted Eligibility Determination Form for Use with Underrepresented Students in Kindergarten through Twelfth Grades (Plan B Matrix) currently being utilized by the Division of Advanced Academic Programs. In this Matrix, students are awarded from 0 to 4 points in specified categories in each of the following areas: Gifted Characteristic Checklist,

Achievement Percentile Score, Intelligence Test Quotient, and Creativity Measure Score. The Achievement Percentile Score applied to the matrix are cutoff points for the FCAT SSS for either the Reading or the Mathematics Test. The cutoff scores were determined in an effort to provide an equi-percentile distribution of the points which had been awarded using the earlier FCAT NRT system. With the transition to FCAT 2.0 standards, different score scales are used and the score cutoffs for determining achievement points need to be recalculated. The FCAT 2.0 uses a vertically-aligned scale that has a different range and distribution for each grade level.
